

Concrete Wash Out

Helping to protect the Environment

On our Cornbrook Project we have implemented a Concrete Washout system to prevent the discharge of pollutants entering local water sources. A designated Concrete Washout area has been established and whereby Environmental training has been delivered to all operatives to ensure the process is managed efficiently.

How the Concrete Washout System @ Cornbrook works:

Using the method above, having the final concrete wagon take away, (by pumping) the previous washouts throughout the day, will have a positive impact for the following:

1. Help prevent wastage on site.
2. Prevents spillage of overflowing washout areas.
3. Minimizes environmental footprint

This is a method we are using throughout the duration of our project and hope to implement this on future projects.
